ADGIPS

The ML Development Bottleneck

High Barrier

Building production ML is gatekept by deep requirements in statistics, advanced Python coding, and complex DevOps infrastructure.

The "Grunt Work" Trap

Data scientists waste 80% of their valuable time acting as "Data Janitors"—cleaning nulls and fixing formats manually.

Fragmentation

Data cleaning, model training, and API deployment happen in isolated silos, leading to broken pipelines and slow iteration.

Introducing NoCodeML

An intelligent, agentic IDE that acts as the **Cursor** for your data.

- > **Concept:** A unified platform that replaces manual coding with agentic intent.
- > **Promise:** Raw CSV/SQL In Production API Out.
- > **Zero Friction:** No manual preprocessing. No server setup. Just results.
- > **The "Magic":** Driven by a swarm of 20+ specialized AI agents working in concert.

The **Agentic** Swarm

The Orchestrator: A central "Manager Agent" breaks down your high-level goal into executable tasks.

The Workers: 20+ specialized agents collaborate autonomously to solve the ML puzzle.

The Result: A self-healing, self-optimizing pipeline that writes its own code, tests its own models, and deploys its own infrastructure.

```
> Initiating Swarm Protocol...  
> Agents Online: 24  
> Status: Optimization Active
```

Meet the Squad

Data Janitors

Context-aware agents that don't just delete nulls—they understand *why* data is missing and impute it intelligently.

The Scientists

Competitive agents that pit XGBoost, LightGBM, and Neural Nets against each other to find the absolute best fit.

DevOps Engineers

Agents that write the Dockerfiles, configure the FastAPI endpoints, and handle the cloud deployment instantly.

From Upload to API

Input

Drag & drop raw CSV and type
your goal: "Predict Churn"

Processing

Watch the logs as the Agent
Swarm debates, cleans, and
trains.

Optimization

Autonomous Hyperparameter
Optimization (HPO) runs in the
background.

Deploy

Receive a **cURL** command. Your
model is live.

Why We Win

Feature	Standard AutoML	NoCodeML (Agentic)
Data Cleaning	Rigid, static rules	 Context-Aware Agents
Feature Engineering	Basic selection	 Generative Creation
Transparency	Black Box	 Full Agent Reason Logs
Deployment	Often Manual / Complex	 One-Click Automated

Built for **Scale**

Frontend

React / Next.js for a seamless, "Cursor-like" developer experience (DX).

Orchestration

LangGraph & CrewAI to manage state and collaboration between the 20+ agents.

ML Core

PyTorch, Scikit-Learn, and Optuna powered by Docker & K8s infrastructure.

The Impact

80%

Time Saved on
Data Cleaning

20+

Specialized
Agents
Deployed

10x

Faster Time
to
Production

Future Roadmap

Conversational Tuning

Chat with your model to refine parameters naturally: "Make it less sensitive to price."

Multi-Modal

Expanding beyond tabular data to support Image classification and NLP text analysis.

Agent Marketplace

Allowing the community to publish and share their own specialized agent architectures.

Democratizing Intelligence

We are removing the technical gatekeepers of AI.

Idea + Data = Product
